

Current and Pending Support

Gary Leo Welz

Principal Investigator, NSF CISE CORE (IIS) Proposal

Current Support

None

The Principal Investigator has no current support from any federal agency, foundation, or other funding source for the proposed research or related activities.

All work on the image.png and related components (CopernicusAI platform, Programming Framework, Genome Logic Modeling Project (GLMP), Research Paper Metadata Database, Science Video Database) has been entirely self-funded by the Principal Investigator.

Pending Support

None

The Principal Investigator has no pending proposals or applications for funding that would overlap with or conflict with the proposed NSF CISE CORE research.

Overlap and Conflict of Interest

No Overlap or Conflict: There are no current or pending sources of support that would create overlap or conflict of interest with the proposed NSF research.

Self-Funded Prior Work: The existing CopernicusAI Knowledge Engine components represent prior work that has been entirely self-funded. These prototypes serve as the foundation and proof-of-concept for the proposed research, but the proposed NSF research will extend significantly beyond the current prototypes through:

1. **Research Briefing Interface Design:** New research on iterative refinement loops and evaluation frameworks (beyond current operational system)
2. **Unified Metadata Representation:** Development of canonical schemas and cross-modal linking algorithms (beyond current separate databases)
3. **Reliability Mechanisms:** Research on multi-checker workflows and error detection systems (new research component)
4. **Process Visualization Integration:** Extension of Programming Framework and integration research (beyond current GLMP application)
5. **Evaluation Studies:** User studies and algorithmic evaluation (new research component)

The proposed NSF research represents a significant expansion into research questions, evaluation methodologies, and systematic study that goes well beyond the current operational prototypes.

Statement of Commitment

The Principal Investigator commits full effort to the proposed NSF research as specified in the proposal (6 months per year for 3 years). The self-funded prior work provides a foundation but does not create a conflict, as the proposed research addresses distinct research questions and evaluation objectives.
